DOSname

DOSname is a small software that gets you the DOS form of a specified path or file. I've been using this for ages, never came round to actually put it online, but there we are. If you occasionally need to get the (short) form of a path or filename, this tool comes to help. Here are some key features of "DOSname":

- Gets the DOS (short) form of a specified path or file
- User friendly Select Dir and Select File buttons to browse to your file or folder
- Works also from the Command Prompt

Bugs, Bugs and Bugs! Some of the bugs are:

- You should be able to create as many DOSnames as you want, if you had more than one you would see the possibility to rename them in the first drop down.
- When using a fully qualified path, it should only return the short form of that path, it shouldn't return the long one.
- If you select a filename, it should just return the short form of that filename, it shouldn't return any path.
- You cannot select a directory in the Select Dir dropdown
- If you press "Retry", it won't revert to "the selected file or directory", it'll just keep returning the same file/directory that it was on.
- When creating new DOSnames, it sometimes does not save your changes.
- It will sometimes return all the files/directories in the selected folder
